# Changes in Southern Hemisphere Westerly Winds affect Southern Ocean CO<sub>2</sub> outgassing

- Southern Hemisphere Westerly Winds are the strongest wind system on the planet
- Hypothesized changes in latitudinal position affect strength and/or intensity variability
  - Weakened northerly position
  - Strengthened southerly position
- Increasing strength and/or intensity affects Southern Ocean storage/release of CO<sub>2</sub>

(Toggweiler and Russell, 2008)

### Atmospheric dust properties are used as proxy for atmospheric reconstructions

- Dust and temperature are anticorrelated
- Increase in dust related to increases in:
  - Aridity
  - Glacial activity
  - Decreases in sea level

### Particle volume metrics provide climatic information

- Changes in mode particle volume/diameter occur at different climatic periods
- Koffman et al. (2014) used relationship to assess Southern Hemisphere Westerly Wind variability

### Particle volume metrics have been used to reconstruct Westerly Wind variability

Koffman et al. (2014)

Previous dust volume analyses have been made under the assumption of spherical particles

# Abakus laser particle counter measures backscatter imaging

- Continuously measured particles
- Particle shape is assumed to be sphere
- Particles are sorted by diameter measurements

# Coulter Counter measures particles based on electrical resistivity

- Electrical resistance is proportional to particle volume
- Discrete measurements rather than continuous

# Use of Dynamic Particle Imaging (DPI) as a tool for shape analysis

- FlowCAM uses dynamic particle imaging technique to measure particle properties
- Used by biological and pharmaceuticals analyses
  - Biological community to assess phytoplankton populations (Sieracki et al., 1998)
  - Pharmaceuticals community to measure microparticles (Matheas et al., 2020)
- Aspect Ratio is measured via b:a axis
  - 1 = circular/square
  - 0 = elongated particle

## SPICEcore Abakus dust concentrations are similar to previous records

- SPICEcore dust concentration similar to other South Pole and Antarctic dust and dust proxy profiles
- IceCube Dust logger
  - r = 0.82
  - p-value < 0.001
- Dome C nssCa<sup>2+</sup>
  - r = 0.89
  - p-value < 0.001

(Fischer et al., 2007; IceCube Collaborators, 2013)

#### Temporal differences in Abakus and Coulter Counter relationships

### South Pole particle shape are normally distributed and semi-circular

#### Mode coarse particle size distributions

#### Coarse particle shape varies temporally

- Temporal distributions are statistically different
  - Student t-test
  - Termination I compared to LGM and Heinrich Stadial 4+5 are statistically different
  - LGM and Heinrich Stadial 4+5 are similar

#### Coarse particle shape varies temporally

- Increase in median and standard deviation variability during Termination I
- Particle shape prior and during LGM are semi-spherical
- Particle shapes during Termination I range from spherical to elongated

(Steig et al., 2020)

### Max, Median, and Minimum shape adjustments for coarse particles

- Median shape calibration adjusts Abakus distribution mode to match Coulter Counter mode
- Median particle shape adjustment coarse mode is most similar to Coulter Counter distribution

# Assessing implications of increased particle shape heterogeneity?

- Calibration implications
  - Longest record of particle shape
  - Particle shape is temporally variable on millennial scales
- Climatic implications
  - Elongated particle orientated along long axis have lower settling velocities (Saxby et al., 2018)
  - What climatic parameter(s) are responsible?
    - Changing depositional style (dry/mixed/wet)?
- Shape effects light scattering
  - +/-Δ dust of aerosol optical depth gradients (Potenza et al., 2016)
  - +Δ extinction efficiency in elongated particles relative to spheres (Kalashnikova and Sokolik, 2004)
