

A brief summary of IBEX observations of the heliospheric interaction

Saturday, 29 October 2011 14:30 (20 minutes)

This talk summarizes the recent observations of the interaction of the heliosphere with the local interstellar medium as observed remotely by the Interstellar Boundary Explorer (IBEX). IBEX observations have shown that the interaction is far more complex and dynamic than previously anticipated and raised many new questions about this important interaction.

Presenter: Dr MCCOMAS, David (Southwest Research Institute)

Session Classification: Heliosphere and Local ISM I
