## Status of US Short Baseline Reactor Effort

*Tuesday, 14 May 2013 14:20 (20 minutes)*

It has been demonstrated that properly optimized very-short baseline reactors experiments have the ability to definitively test the reactor antineutrino anomaly by probing reactor oscillations with baseline and position at baselines of order 5 to 10 m. This talk will outline the design of a US-based very short baseline reactor experiment and give a status report on R&D for this experimental effort.
