

## Candidate sites in Argentina for air-shower particle detectors at high altitudes

*Friday, 11 November 2016 14:30 (30 minutes)*

High altitude regions in Argentina are available for water Cherenkov gamma-ray astronomy. In the North-west of the country areas of ~1 km<sup>2</sup> have been identified and studied for astronomical purposes at altitudes greater than 3500 masl. Particularly, a site nearby San Antonio de los Cobres (Salta) is being developed for LLAMA, a project in cooperation with Brasil (50/50). LLAMA is a single dish radiotelescope planed to perform interferometry with ALMA; access roads, power, connectivity and housing is being provided by Argentina in its location at 4850 masl.

In this talk I will describe the site for LLAMA and few others suitable for water Cherenkov gamma-ray astronomy, with good access and availability of water. As done for LLAMA, local support at National and Provincial levels are a plus in Argentina, where several groups have expressed their interest to participate in the development and operation of the new Southern water Cherenkov gamma-ray observatory.
